Subject: fluoridation questions

Rocky
What level of fluoride does the Town add to its water? Is it the recommended .7 ppm or a higher level?

How often do we sample to test this level of fluoride?

What is the base level of fluoride in Town water? The level present naturally prior to our supplement program?

If we measure fluoride levels, are we measuring total fluoride present or just the amount we add?

How is the fluoride introduced to the water supply and is the equipment calibrated regularly?

When did we begin adding fluoride?

Thanks, Jon
